## Summary

Junior Full Stack Developer with hands-on experience building SaaS and AI-driven applications using Python and TypeScript. Skilled in developing end-to-end systems with Django, NestJS, and Next.js, including APIs, real-time features, and deployment. Focused on creating efficient, scalable, and user-centered solutions.

## Work Experience

### Team Lead / Full Stack Developer Intern

Nov 2025 – Feb 2026

*System Sense Corporation*

- Streamlined restaurant ordering workflows by contributing to an MVP B2B SaaS self-ordering POS platform, reducing manual order processing through full-stack development
- Automated menu, order, and transaction management by developing RESTful APIs using NestJS and PostgreSQL, improving system efficiency and data handling
- Improved dashboard usability and customer ordering experience by building responsive interfaces using Next.js, MUI, and ShadCN
- Enabled real-time order tracking and consistent deployment by implementing WebSocket-based updates and Docker containerization
- Ensured code quality and maintainability by implementing CI/CD practices in GitHub, including automated lint checks before pull requests
- Increased application reliability by performing end-to-end testing using Playwright to validate core functionalities

### Part-Time Full Stack Developer

Jan 2025 – Jun 2025

*Avorino Custom Home Builder Company*

- Simplified project tracking and task management for construction teams by contributing to the development of SimpleProjex, an internal workflow tool
- Automated project data handling and task updates by developing backend APIs using Django Ninja, improving workflow efficiency
- Accelerated feature delivery by expanding from backend to full-stack development, implementing both frontend and backend functionalities
- Improved system stability and user experience by performing API testing, debugging, QA, and validating application behavior
- Enhanced UI/UX design by researching design trends and creating mockups using Canva, proposing improvements to the product owner

## Education

### Bachelor of Science in Computer Engineering

2022 - 2026

*Holy Angel University*

### Science, Technology, Engineering, Mathematics (STEM) Strand

2020 - 2022

*Angeles city Science High School*

Skills

| Languages                                                                                                                                        | Frameworks and Libraries                                                                                                                                                                                           | Databases                                                                                                                                                                                               | APIs & Architecture:                                                                                                                                                                                                                                                         | Tools & Platforms                                                                                                                                                                                   |

Projects

An AI-Powered Fingerprint-based Analyzer for Diabetes Risk and Blood Group Prediction

2025 – 2026

Thesis project

- Enabled non-invasive diabetes risk screening and blood group awareness by developing an AI-powered fingerprint kiosk system
- Achieved real-world data collection for model training by designing and building a hardware-based kiosk integrated with fingerprint scanning
- Improved dataset quality for predictive modeling by collecting and curating custom dermatoglyphic and demographic data through fieldwork
- Generated predictive health insights by building CNN and Random Forest models using the collected dataset
- Supported accurate feature selection by analyzing the relationship between fingerprint patterns, diabetes risk, and blood group
- Integrated end-to-end system functionality by developing a full-stack platform using Next.js, Django/Flask, and Supabase PostgreSQL
- Delivered accessible screening results by deploying the system on Vercel and Railway with QR-based reporting
